

# Confronting Climate Change and the Farm Crisis: A Call for a Just Transition

## The Farm Crisis and the Climate Crisis Are Linked

**Farmers and rural workers in the United States are increasingly threatened by the devastating impacts of climate change as well as by the impacts of the farm crisis,** leading to the loss of family farms and the deepening economic decline of rural areas. These crises are mutually reinforcing.

The same factors that are driving the farm crisis – the increasing concentration of corporate power and pro-agribusiness farm policies that encourage chronic overproduction and squeeze family farmers with low prices – are also the factors driving the climate and environmental crises. Monoculture crop production relies on chemicals and fossil fuels, and the contract-based model of factory farm livestock production is a major source of pollution and carbon emissions.

**Overproduction** is a major reason why agriculture contributes to the climate crisis and is also a major reason why there is so much economic pressure on family farmers to ‘get big or get out.’

## We can't address one crisis without confronting the other.

Because these crises are linked, they must be addressed together: transitioning to a model of agriculture that is good for the climate means ensuring that family-scale farms can flourish, and protecting and investing in rural communities will mean little without a just transition to a regenerative, agroecological model of agriculture.

**A just transition in agriculture would prioritize the right to food and shift economic and decision-making power back to food producers,** ensuring fair prices and fair wages. Food production would be based on principles of ecology like diversity, which must be practiced at a smaller and more local scale. To achieve this goal, rural, frontline, and agricultural communities must be at the policy-making table.

As part of an international development and human rights organization, ActionAid USA recognizes that reducing greenhouse gas emissions in our food and agriculture system requires supporting more people to take care of the land and water on diversified, family-scale farms. This will only happen when we economically and politically empower farmers and historically marginalized communities as leaders in the climate crisis.

The following principles **to ensure equity and justice should be at the core of the work** to transform the corporate, industrial, extractive model of agriculture in the United States:

**1. Farming is based on ecological principles like biodiversity and resilience, as well as traditional and indigenous knowledge and practices.** Policies support smaller-scale farms producing a diversity of crops and raising animals for local and regional markets, not extractive models of monocropping and factory farming which deplete, rather than regenerate, resources.

**2. Food producers earn a fair livelihood through fair prices and fair wages that bring “more hands onto the land.”** This will require dismantling corporate control in agriculture, ensuring that those who produce food can access land and resources, and reining in chronic overproduction that encourages overconsumption and drives low prices and low wages that are the basis of “Get Big or Get Out” agriculture.

**3. Respects and repairs the injustice done to black, indigenous, and people of color communities,** recognizing the leadership and knowledge of communities leading the transition. Ensures increased communication and dialogue.

**4. Rooted in human rights, especially the human right to food,** in order to democratize the food and agriculture system and rebalance power in the economy.

**5. Supports real solutions to the climate and farm crises,** not climate schemes that rely on untested technological fixes and market-based mechanisms (like Bioenergy with Carbon Capture and Storage, carbon pricing, and carbon offsets) or farm policies that rely on the global agribusiness model (like increased reliance on foreign exports and free trade).
